

Build a 3D Website, Brand Guide and Ads With Opus 5.5

A solar website gives you plenty of reasons to use 3D. You can turn the house, panels, battery and phone into objects people can explore. The harder part is making all those scenes feel like the same brand.

In this tutorial, I use [Claude Code](#) with Opus 5.5 and references from [Mobbin](#) to build Sunset, a Japanese solar and home-battery concept. I then extend the website into a brand guide and advertising mockups. The supplied files also use the name Sunseto.

Mobbin sponsors this video.

Actual Sunset project screenshot. The companion download includes the landing page, brand guide, ads and all three selected source folders.

Ask for screenshots before you ask for a website

I start by asking Mobbin for five websites that could inspire a solar-panel business. The first response gives me links, so I ask for screenshots too. That extra step gives us something concrete to discuss.

Choose references for specific sections. In the recording, I use Daylight as a starting point, ask for charts from Origin, and look for other testimonial and pricing layouts. I ask the agent to plan five to ten sections before it starts building.

This makes the conversation easier. I can point to the map, chart or layout I want to study, then explain how it should change for Sunset. A useful reference gives you a decision to make.

Give the whole page one visual direction

The brief brings several choices together: Japanese architecture, solar-panel grids, sakura, warm sunset colors and a light paper background that transitions into darker scenes.

I want the house, phone and charts in [Three.js](#). I also ask for a floating menu instead of the reference's giant headline. Those changes give the page its own direction while preserving useful ideas from the reference.

I speak much of this brief into the microphone. It lets me describe the scene while looking at it: the materials, the light behind the house, the falling petals, and how the sections should connect. The first version will still need work. This gives the agent a clear place to begin.

Choose how each asset should be made

A house is a good candidate for code-generated geometry. People are much harder. In the video, I keep buildings, phones and landscapes in 3D, then ask for generated images where human subjects are needed.

Transparent PNGs work well for stamps, branches and other ornaments. They can sit in front of the scene without bringing a rectangular background with them. I use [Higgsfield](#) or [Aura](#) for image generation, and ask for Iconify's [Solar icons](#) instead of having the agent invent every icon.

Be specific about these choices. Otherwise, the agent may try to draw a complicated illustration using HTML and CSS, even when another medium would fit better.

Improve one visible weakness at a time

The first 3D pass needs better materials and lighting. I ask for detailed wood textures, enough resolution for a Retina display, and light that feels closer to a game scene. Then I ask the agent to score each scene and keep improving it against the references.

That score is an editing aid. I still inspect the result. Does the wood read as wood? Is the phone sharp? Can I see the sun in the footer? Would a taller section give the landscape more room?

The recording shows the new build still running after about an hour. I point out rough textures and images that need another pass. The polished example at the start and the work in progress at the end represent different stages of the process. Expect several rounds of direction.

Make motion belong to the design

The most useful motion ideas are easy to describe. Let a 3D object rotate a little when the pointer moves. Let visitors drag it to see another angle. Make the water respond with ripples. Separate the couple from the background and move those layers at different speeds as the page scrolls.

The sunset also appears in the buttons and footer, so the effects share the page's subject. For the button treatment, I move from a simple gradient toward a shader effect. For a framed illustration, I ask for a wooden container that feels at home in the rest of the design.

These are small, specific requests. Each gives the agent something visible to build and check.

Extend the website into a brand system

Once the visual direction is established, I ask for a brand guide with the colors, typography, hierarchy, logos and assets. I also ask for advertising concepts on billboards, business cards, T-shirts and subway placements.

I give these jobs separate tasks so they can develop around the existing website. The website remains the reference for the brand work. I also set a spending rule before image generation: ask before going over my stated budget.

The download includes the three HTML pages and all three selected project folders. Start with `sunset.html`, then explore `sunset-brand.html` and `sunset-ads.html`. Keep the folders alongside the pages, and use a local server for `sunset-3d/index.html`.
